

MyoBridge™ Volunteer Donor Program

The MyoBridge Volunteer Donor Program is a tissue sourcing program that connects researchers with human muscle samples donated by real-world participant populations in healthy and disease-specific demographics.

Find the exact donor characteristics that you need to advance your research. MyoBridge simplifies cell sourcing, limits variables, and enables research specificity.

How does MyoBridge work?

All MyoBridge contracts begin with an exploratory call to establish deliverables, best approach, and any unique considerations for your research program.

Once the study begins, our clinical partners recruit the appropriate donors, execute the tissue collection study, and ship the tissue to our Pittsburgh facility for processing.

Cell samples are shipped via reliable cold-chain logistics to any location worldwide.

Our team determines the appropriate protocol for an IRB-approved tissue collection study. If our existing protocols are not suited to your request, we will draft a new protocol.

Our experienced Custom Cell Solutions team processes the tissue according to your specifications, performs quality testing & any requested analytical services, and validates cell performance.
